

## Market Announcement

28 July 2020

# Laverton Exploration Update

### Highlights:

- **Beasley Creek Area continues to deliver high-grade intersections, including:**
  - **20BSRD005 – 10.05m @ 9.13g/t Au from 252.25m**
  - **20BSRD012 – 6m @ 31.06g/t Au from 32m**
- **Further Mineral Resource upgrades expected in Q3 2020**

West Australian gold explorer Focus Minerals (ASX: FML) (Focus or the Company) is pleased to provide an update on its Laverton Gold Project.

## Beasley Creek Area

### *Beasley Creek South*

In late June, Focus received the assay results of the deepest hole to date at Beasley Creek South – 20BSRD005 (using 0.5 g/t Au cut off, up to 3m internal dilution and full dilution of any core loss to 0.00 g/t Au include)

Hole ID	Interval (m)	Grade (g/t)	From (m)
20BSRD005	1	4.07	41
	3	1.91	50
	4	3.6	80
	2	7.26	110
	10.05	9.13	252.25

Hole 20BSRD005 intersected the main lode at 230m vertical depth from surface and also delivered several strong hanging wall mineralisation intersections. The hole was stopped in mineralisation due to drilling issues but, still recorded a very strong intersection.

#### Focus Minerals Limited

ACN 005 470 799 | ABN 56 005 470 799 | ASX: FML

Level 2, 159 Adelaide Terrace, East Perth WA 6004 | PO Box 3233, East Perth WA 6892

T +61 (0) 8 9215 7888 | F +61 (0) 8 9215 7889 | E [info@focusminerals.com.au](mailto:info@focusminerals.com.au) | W [focusminerals.com.au](http://focusminerals.com.au)

The result of 20BSRD005 was not included in the JORC 2012 Mineral Resource upgrade<sup>1</sup> due to the late arrival of the result.

The location of 20BSRD005 can be found in Figure 1.

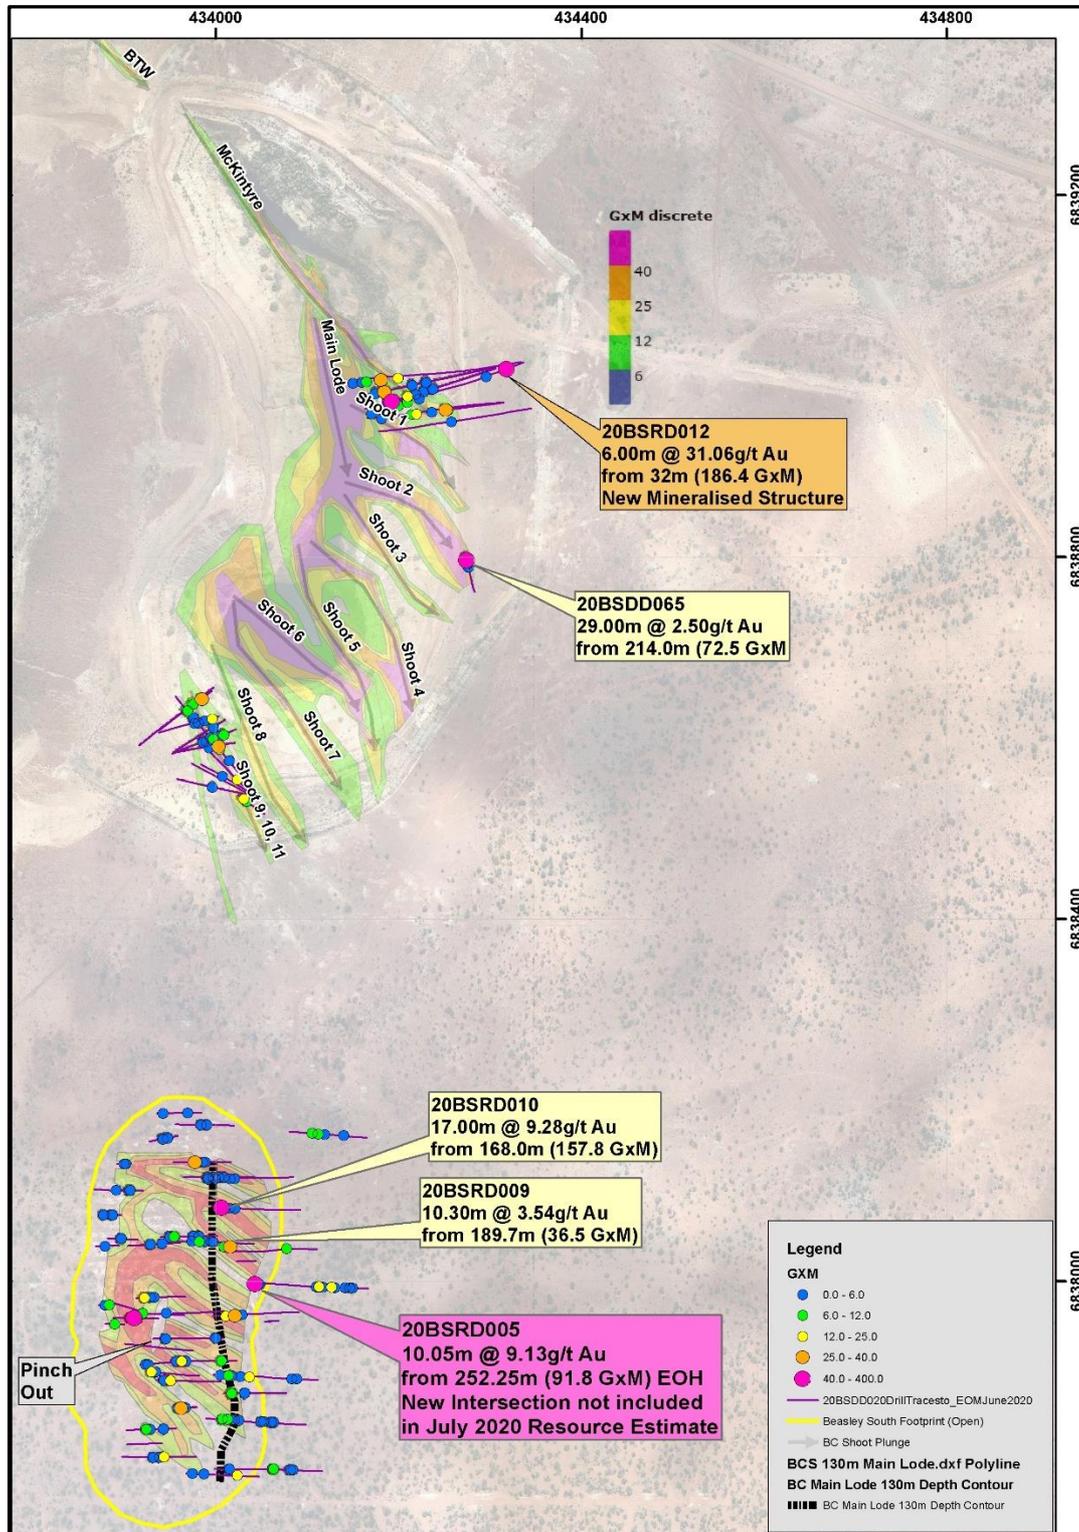

Figure 1: Locations of 20BSRD005 and 20BSRD012

<sup>1</sup> ASX Announcement: 15 July 2020

## Beasley Creek

The recent drilling campaign was strategically targeted to:

- infill parts of the resource not optimising due to insufficient drilling/lower resource classification and;
- gamma logging to refine bulk density of geological domains for Mineral Resource upgrade in Q3 2020.

Hole 20BSRD012 intersected a new high-grade structure in weathered mafic volcanics (using 0.5 g/t Au cut off, up to 3m internal dilution and full dilution of any core loss to 0.00 g/t Au include).

Hole ID	Interval (m)	Grade (g/t)	From (m)
20BSRD012	6	31.06	32

The structure was intersected in the pre-collar to a diamond tail. The area has almost no drilling and the significance of the intersection will be determined by follow up drilling.

To confirm the nature of high-grade mineralisation intersected by this hole a small sample from interval 33 – 34m was panned and returned a tail of gold.

Figure 2: Panned tail of gold grains from 20BSRD012

The location of 20BSRD012 can be found in Figure 1.

In addition to the strong intersection from 20BSRD012, the following drill holes returned with assay results that are larger than 18 GxM (grade multiplied by interval) (using 0.5 g/t Au cut off, up to 3m internal dilution and full dilution of any core loss to 0.00 g/t Au include).

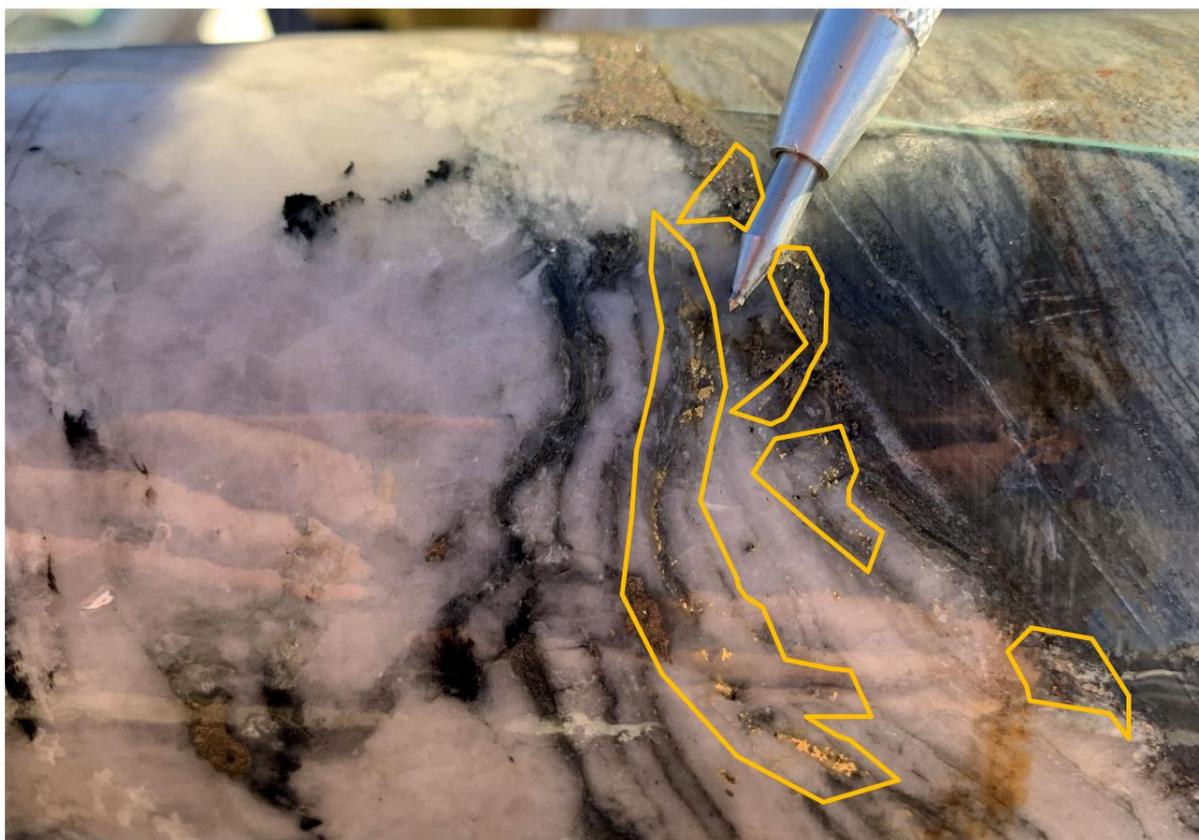

Hole ID	Interval (m)	Grade (g/t)	From (m)	GxM
20BSDD065	29	2.5	214	72.5
20BSDD051	16	2.55	186	40.8
20BSDD063	6.5	5.54	100.3	36.0
20BSRD013	33.45	0.92	234	30.8
20BSDD052	5	5.76	74	28.8
20BSDD055	11	2.52	184	27.7
20BSDD066	11.15	2.32	53	25.9
20BSRD015	9.2	2.64	90.8	24.3
20BSDD054	7	2.9	72	20.3
20BSDD051	5	3.82	162	19.1
20BSRD015	3.1	5.97	148.9	18.5

## Karridale

### *Data Acquisition for the Stage 1 Pre-feasibility Study*

During the June quarter 2020, three diamond holes were drilled from surface at Karridale for 537.8m. The holes were targeted to intersect optimised pit walls from the scoping study. These holes will be used for:

- Geotechnical logging to refine PFS open pit design.
- PQ3 core was predominantly drilled so that sufficient sample for comminution test work was available to inform the Stage 1 PFS
- All holes were gamma logged to refine bulk density determination ahead of the Mineral Resource upgrade in Q3 2020
- The holes have been wrapped in plastic and will not be cut for assay until after all metallurgical sampling has been concluded

*Figure 3: Visible gold in PQ3 core of Hole 20KADD002 from 117.65m to 117.7m*

## Lake Carey

Final results were received from the Lake Carey drilling program. No assays above 0.5 g/t Au were returned. Some multi-element sampling will be completed to assess if there are any pathfinder vectors associated with strong alteration intersected by hole 20LCDD001.

The release of this ASX announcement was authorised by  
Mr Zhaoya Wang, CEO of Focus Minerals Ltd.

**About Focus Minerals Limited (ASX: FML)**

Focus Minerals is a Perth-based, ASX-listed gold exploration company focused on delivering shareholder value from its 100%-owned Laverton Gold Project and Coolgardie Gold Project, in Western Australia's Goldfields.

The flagship Laverton Gold Project covers 386km<sup>2</sup> area of highly prospective ground that includes the historic Lancefield and Chatterbox Trend mines. Focus' priority target is to confirm sufficient gold mineralisation at the Beasley Sheer Zone, Lancefield-Wedge Thrust and Karridale to support a Stage 1 production restart at Laverton. In parallel, Focus is working to advance key Laverton resource growth targets including Sickle, Ida-H and Burtville South.

Focus is committed to delivering shareholder value from the Coolgardie Gold Project, a 175km<sup>2</sup> tenement holding that includes the 1.2Mtpa processing plant at Three Mile Hill (on care and maintenance), by continuing exploration and value-enhancing activities.

**Competent Person Statement**

The information in this announcement that relates to Exploration Results is based on information compiled by Mr Alex Aaltonen, who is a Member of the Australasian Institute of Mining and Metallurgy (AusIMM). Mr Aaltonen is an employee of Focus Minerals Limited. Mr Aaltonen has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of *the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves*.

# JORC Code, 2012 Edition – Table 1

## Section 1 Sampling Techniques and Data

Criteria	Explanation
Sampling techniques	<p><i>RC Sampling (Precollars Only)</i></p> <ul style="list-style-type: none"> <li><i>RC percussion drill chips were collected through a cone splitter from the drill rig. The bulk sample from drilling was placed in neat rows directly on the ground (not bagged) with the nominal 2-3kg calico split sub-sample placed on top of the corresponding pile.</i></li> <li><i>RC chips were passed through a cone splitter to achieve a nominal sample weight of approximately 3kg. The splitter was levelled at the beginning of each hole. Geological logging defined whether a sample was to be submitted as a 1m cone split sample or a 4m spear composite sample. Split samples (1m) were transferred to sample numbered calico bags for submission to the laboratory. Composite samples were spear sampled using a scoop to obtain a small representative sample and deposited into numbered sample bags.</i></li> </ul> <p><i>Diamond Sampling</i></p> <ul style="list-style-type: none"> <li><i>Diamond core was sampled across geologically identified zones of mineralisation, the sample widths varied between a minimum of 0.2m and a maximum of 1.2m with material on either side sampled to capture the entire mineralised zone.</i></li> <li><i>The diamond core was marked up for sampling by the supervising geologist during the core logging process, with sample intervals determined by the presence of lithology, alteration and where applicable core loss. The core was cut in half using a core saw and the same half of the core (RHS looking downhole) was routinely sent to the laboratory for analysis. Some soft core was sampled half by using a bolster, and some fractured quartz core were cut in half by using manual diamond core saw to ensure half core was sampled.</i></li> <li><i>A small number of whole core samples were routinely collected for bulk density analysis. These samples were submitted to the same lab for gold analysis after bulk density measurement.</i></li> </ul>
Drilling techniques	<ul style="list-style-type: none"> <li><i>RC drilling was conducted using a 5 3/8inch face sampling hammer for RC drilling.</i></li> <li><i>Two RC holes were drilled with 5 inch AC bits and controlled drilling</i></li> <li><i>The 2018 RC drill programs indicated that there was no amount of air that could be used to deliver consistently dry and uncontaminated samples within the Beasley SZ using face sampling hammer. The issue is related to the highly water loaded and sticky clays located within the Beasley SZ at Beasley Creek South. This issue was not encountered to such a high degree on the north side of the Fitton FZ which appears to separate two different zones of hydrogeology. Quality RC samples could not be achieved and the program was cut short.</i></li> <li><i>At hole completion, downhole surveys for RC holes were completed at a 10m interval by using True North Seeking Gyro tool.</i></li> <li><i>At hole completion diamond holes were survey using a single shot tool at a range of intervals between 20m and 50m, averaging 30m</i></li> <li><i>Diamond drill holes with dips less than 50 degrees were collared from surface to a predetermined depth using a rock roller bit.</i></li> <li><i>Where possible on holes with dips more than 50 degrees an RC pre-collar was completed to improve drilling efficiency. To date the sample recovery of the shallow RC pre-collars (located laterally away from the Beasley SZ) has been acceptable and results are considered to be usable for resource estimation</i></li> <li><i>All pre-collars where cased off and the diamond component of the drill hole completed using HQ3 (producing 63mm core diameter) equipment.</i></li> <li><i>Wherever core conditions and hole orientation would allow, drill core was oriented by the drilling contractor using the electronic ACT III Tool.</i></li> </ul>
Drill sample recovery	<ul style="list-style-type: none"> <li><i>RC sample recovery was recorded in 10% increments as a visual estimate during the logging process. In general RC recovery was good to within a few meters of the Beasley SZ. Once the Beasley SZ was encountered RC recovery ranged from 10-80% and averaged less than 60%. These RC holes and RC with AC drill bit holes are not being used for resource estimation purposes within the Beasley SZ</i></li> <li><i>DD sample recovery was measured and calculated (core loss) during the logging process. DD core had generally reasonable recovery &lt;10% core loss in and around mineralisation. Some holes had more than 20% core loss. Where this core loss was</i></li> </ul>

Criteria	Explanation
	<p><i>experienced around HG and VHG it likely had a material impact on the calculated intersection grade as all core loss was fully diluted and assigned a grade of 0.0g/t Au.</i></p>
<p><i>Logging</i></p>	<ul style="list-style-type: none"> <li>• <i>All RC samples were geologically logged to record weathering, regolith, rock type, colour, alteration, mineralisation, structure, texture and any other notable features that are present. All data is entered directly into validating digital software directly.</i></li> <li>• <i>All core samples were oriented where possible, marked into metre intervals and compared to the depth measurements on the core blocks. Any loss of core was noted and recorded in the drilling database.</i></li> <li>• <i>All diamond core was logged for structure, geology and geotechnical data using the same system as that for RC.</i></li> <li>• <i>Logging was qualitative, however the geologists often recorded quantitative mineral percentage ranges for the sulphide minerals present.</i></li> <li>• <i>The logging information was transferred into the company's drilling database once the log was complete.</i></li> <li>• <i>Diamond core was photographed one core tray at a time using a standardised photography jig. RC chip trays are routinely photographed.</i></li> <li>• <i>The entire length of all holes is geologically logged, except for rock roller diamond pre-collars, which produce no sample.</i></li> </ul>
<p><i>Sub-sampling techniques and sample preparation</i></p>	<ul style="list-style-type: none"> <li>• <i>All samples were collected in a pre-numbered calico bag bearing a unique sample ID.</i></li> <li>• <i>At the assay laboratory, all samples were oven dried, crushed to a nominal 10mm using a jaw crusher (core samples only) and weighed. Samples in excess of 3kg in weight were riffle split to achieve a maximum 3kg sample weight before being pulverized to 90% passing 75µm.</i></li> <li>• <i>Gold analysis was by 40g Fire Assay with an AAS Finish.</i></li> <li>• <i>Jinning Testing &amp; Inspection completed the assay testing, with sample preparation completed in Kalgoorlie or Perth and analysis completed in Perth.</i></li> <li>• <i>The assay laboratories' sample preparation procedures follow industry best practice, with techniques and practices that are appropriate for this style of mineralisation. Pulp duplicates were taken at the pulverising stage and selective repeats conducted at the laboratories' discretion.</i></li> <li>• <i>QAQC checks involved inserting standards 1:20 samples (with minimum 3 standards every submission). Duplicate samples for RC were achieved by producing 2 samples for each metre one hole every 20<sup>th</sup> hole drilled and submitting all produced samples. The remaining bulk sample was also bagged to plastic bags for retention and further checks. Diamond core field duplicates were not taken.</i></li> <li>• <i>Regular reviews of the sampling were carried out by the supervising geologist and senior field staff, to ensure all procedures were followed and best industry practice carried out.</i></li> <li>• <i>The sample sizes were appropriate for the type, style and consistency of mineralisation encountered during this phase of exploration.</i></li> </ul>
<p><i>Quality of assay data and laboratory tests</i></p>	<ul style="list-style-type: none"> <li>• <i>The assay method and laboratory procedures were appropriate for this style of mineralisation. The fire assay technique was designed to measure total gold in the sample.</i></li> <li>• <i>No geophysical tools, spectrometers or handheld XRF instruments were used for assay determination.</i></li> <li>• <i>The QA/QC process described above was sufficient to establish acceptable levels of accuracy and precision. All results from assay standards and duplicates were scrutinised to ensure they fell within acceptable tolerances and where they didn't further analysis was conducted as appropriate.</i></li> <li>• <i>Umpire samples are collected on a routine basis will be submitted to independent ISO certified labs in 2019</i></li> <li>• <i>Additional bulk mineralised RC samples have also been collected and retained for follow up QAQC, metallurgical and sample characterisation purposes.</i></li> </ul>
<p><i>Verification of sampling and assaying</i></p>	<ul style="list-style-type: none"> <li>• <i>Significant intervals were visually inspected by company geologists to correlate assay results to logged mineralisation. Consultants were not used for this process.</i></li> <li>• <i>Primary logging data is sent in digital format to the company's Database Administrator (DBA) as often as was practicable. The DBA imports the data into an acQuire database, with assay results merged into the database upon receipt from the</i></li> </ul>

Criteria	Explanation
	<p>laboratory. Once loaded, data was extracted for verification by the geologist in charge of the project.</p>
<p>Location of data points</p>	<ul style="list-style-type: none"> <li>• Drill collars are surveyed after completion using a DGPS instrument. Where possible, all drill core was oriented by the drilling contractor using an ACT III electronic system.</li> <li>• A True North Seeking Gyro for RC end of holes surveys or a Reflex single shot camera for diamond drilling was used for "single shot" surveys whilst advancing drilling.</li> <li>• All coordinates and bearings use the MGA94 Zone 51 grid system.</li> <li>• Focus Minerals utilises Landgate sourced regional topographic maps and contours as well as internally produced survey pick-ups produced by the mining survey teams utilising DGPS base station instruments.</li> <li>• After completion the drill hole locations were picked up by DGPS with accuracy of +/- 20cm.</li> </ul>
<p>Data spacing and distribution</p>	<ul style="list-style-type: none"> <li>• Beasley Creek South is being infilled with HQ3 to 20m x 25m spacing or better within identified shoots</li> <li>• Beasley Creek Infil/extension drilling is being completed to infil at 20m x 40m spacing</li> <li>• Geotech and metallurgical drilling at Karridale has been optimised to intersected scoping study level pit wall and infill existing mineralisation to 20m x 20m spacing</li> <li>• Spacing is deemed to be appropriate for the type of mineralisation.</li> </ul>
<p>Orientation of data in relation to geological structure</p>	<ul style="list-style-type: none"> <li>• Drilling was designed based on known/developing geological models, field mapping, verified historical data, cross-sectional and long-sectional interpretation.</li> <li>• Where achievable, drill holes were oriented at right angles to strike of deposit, with dip optimised for drill capabilities and the dip of the ore body. Please note this was not always possible in the NW part of the pit where relatively complex mineralisation has been intersected in the footwall of the Beasley Creek Shear.</li> <li>• True widths have not been calculated for reported intersections. However, drill orientation was wherever possible consistently optimised to approximate true width of mineralisation.</li> </ul>
<p>Sample security</p>	<ul style="list-style-type: none"> <li>• All samples were reconciled against the sample submission with any omissions or variations reported to Focus Minerals.</li> <li>• All samples were bagged in a tied numbered calico bag. The bags were placed into plastic green bags with a sample submission sheet and delivered directly from site to the Kalgoorlie laboratories by Focus Minerals personnel at completion of each hole.</li> </ul>

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	Explanation
Mineral tenement and land tenure status	<ul style="list-style-type: none"> <li>• The drilling was conducted on tenements 100% owned by Focus Minerals (Laverton) Pty Ltd.</li> <li>• All tenements are in good standing.</li> <li>• Beasley Creek South is located entirely within Mining Lease M38/049.</li> <li>• There are currently no registered Native Title claims over the Laverton project areas.</li> </ul>
Exploration done by other parties	<ul style="list-style-type: none"> <li>• Beasley Creek South was discovered by WMC when exploring and then mining at Beasley Creek. Beasley Creek was mined as an open pit to about 85m depth by WMC from 1987-1994 with production of 88.8Koz.</li> <li>• Later exploration has been performed by Metex/Delta Gold 1996/1997 and then Crescent Gold from 2010-2011.</li> <li>• Karridale was previously mined as small scale working in the early 1900's. Some small oxide resource were identified by Sons of Gwalia in the 1990's and an open pit was mined at the nearby Burtville Deposit</li> </ul>
Geology	<ul style="list-style-type: none"> <li>• Mineralisation at Beasley Creek and Beasley Creek South are located on the moderate East dipping Beasley Shear Zone. To date mineralisation is confirmed over +750m strike at Beasley Creek and +500m Beasley Creek South.</li> <li>• The Beasley SZ is deeply weathered to ~80-100% clay in all drill intersections completed to date to 230m vertical depth.</li> <li>• The Beasley SZ is sandwiched between Hanging-wall (Eastern) Mafic-high magnesium volcanics and Footwall (western) Ultramafic intrusions and Feldspar-hornblend porphyries.</li> <li>• The weathered rocks within the Beasley SZ include:               <ul style="list-style-type: none"> <li>• saprolitic clays,</li> <li>• saprock of hydrothermally brecciated sediments, conglomerates and minor black shale,</li> <li>• iron stone after gossan,</li> <li>• laminated veins and,</li> <li>• breccia vein infill.</li> </ul> </li> <li>• Core loss typically occurs when quartz breccia fragments become partially lodged in the drill bit. These hard fragments rotate with the bit causing grinding/washing of the soft highly oxidised shear matrix.</li> <li>• Mineralisation at Karridale is hosted by 25 stacked shallow NNW dipping shear hosted bulk lodes.</li> <li>• The majority of mineralisation is located on the south side of a graben in half graben.</li> <li>• The half graben is filled predominantly by intermediate/mafic volcanics and lesser interflow sediments.</li> <li>• Mineralised shear zones have been developed sub-parallel to the overall volcano stratigraphic layering</li> </ul>
